

Tanvi Waje

Python Developer

Email: tanviwaje10@gmail.com

Ph. No: 9322413376

Address: Islampur, Sangli.

Education

Qualification	Institution	Score	Year
Graduation (B.Tech – Computer Engineering)	Rajarambapu Institute of Technology, Rajaramnagar.	7.80 CGPA First class	June 2026
Class XII	Karmaveer Bhaurao Patil College, Urun Islampur.	59%	April 2022
Class X	Islampur High School, Islampur.	91%	April 2020

Experience

1. Data Analyst Intern - SLO Technologies (Advarisk)
Project: Instant Ownership Check (IOC) January 2026 - May 2026

Projects

1. **Early prediction of liver cirrhosis using machine learning:** Machine learning enables early detection of liver cirrhosis by analysing clinical, biochemical, demographic, and imaging-derived features. Algorithms such as Random Forest, SVM, Logistic Regression, and CNNs can identify suitable disease patterns from datasets.
2. **Student performance prediction system:** Built a machine learning application using Python and MySQL to predict student academic outcomes. Performed data preprocessing and exploratory analysis using Pandas, NumPy, and Matplotlib. Implemented Logistic Regression, KNN, and Random Forest classifiers using Scikit-learn and evaluated models using accuracy and classification metrics.
3. **Bank Management System App:** The project is developed using Python as the primary programming language to handle application logic, input validation, and user interaction. It uses Python libraries pandas for transaction analysis and report generation, NumPy for numerical calculations like balances, totals, and averages, and matplotlib for optional visualisation of transaction trends. The backend is supported by an SQL database (SQLite/MySQL) to store and manage customer details, account information, and transaction records. Core DBMS concepts such as primary and foreign keys, normalization, constraints, and transaction handling using commit and rollback are implemented to ensure data integrity and consistency. The project also makes extensive use of SQL concepts, including CRUD operations (INSERT, SELECT, UPDATE, DELETE), JOIN queries, aggregate functions like SUM, COUNT, and AVG, and date-based queries for retrieving transaction history.

4. **Instant Ownership Check:** Engineered the core AI processing modules for the Instant Ownership Check (IOC) platform to automate property title verification and fraud risk analysis for secured lending using Python, TensorFlow, Scikit-Learn, FastAPI, and SQL. To handle highly fragmented data, I developed robust NLP and OCR pipelines utilizing BERT and LayoutLM models to ingest unformatted, regional-language property registration documents, achieving a 90%+ accuracy rate in extracting critical transaction histories and ownership chains. Additionally, I built a spatial-comparable machine learning model to cross-reference target asset values against recent localized registration data, mitigating collateral-focused lending fraud by ensuring highly accurate property valuations. Finally, I trained specialized anomaly detection models to proactively flag high-risk indicators, such as properties concurrently pledged for multiple loans or short-term multi-owner flipping patterns, directly protecting banking partners from non-performing asset (NPA) risks.

Skills

Technical skills

- Python
- Database Management System (DBMS)
- MySQL
- PostgreSQL
- Pandas, Numpy, Matplotlib, Scikit Learn
- Tableau, Power BI

Soft skills

- Communication
- Team Work
- Decision Making
- Quick Learning
- Problem Solving
- Leadership
- Management

Certifications

- I. Programming with Python – Dell Technologies.
- II. Teach your chatbot to match the topic – Dell Technologies.
- III. Programming in Python with AI – Intershala Training.
- IV. RIT hackathon – Research Paper (Early prediction of liver cirrhosis using ML)
- V. Data Analytics Virtual Internship – AICTE Eduskills
- VI. Internship Certification – SLO Technologies (Advarisk)
